KNOWING THE DIFFERENCE: FIT TEST VS USER SEAL CHECK

A respirator can't protect you if it doesn't fit your face.

- **Fit Test** . Performed once a year or when a new respirator will be used . Performed by a trained person

There are 2 types of fit test: quantitative and qualitative. Qualitative fit test are most common in small businesses. OSHA doesn't require fit test administrators to be certified, just to know how to conduct and interpret a test with appropriate testing equipment.

Ouantitative- Portacount test

Qualitative (pass/fail)

- Bitrex, Saccharin., Banana Oil/Smoke
- Use OSHA approved fit testing protocols

Before an employee uses any respirator with a tight-fitting face piece, the employee must be fit tested with the same make, model, style, and size of respirator that will be used.

User Seal (Fit) Check: Performed every time a respirator is worn Performed by the wearer (once properly trained)

Seal checks are not a regulatory substitute or alternative to fit tests.

Positive-pressure check:

- 1. Block the exhalation valve cover with the palm of your hand.
- 2. Exhale gently into the facepiece, creating a slight positive pressure.
- 3. If you can feel air leaking under the facepiece, reposition it and repeat steps 1 and 2 until you have an effective seal

Negative-pressure check:

- 1. Cover the inlet openings of the cartridges or canisters with the palms of your hands and inhale gently so that the facepiece collapses.
- 2. Hold your breath for about 10 seconds. The seal is effective if the facepiece stays collapsed.
- 3. If the facepiece expands or you can feel air leaking under the facepiece, reposition it and repeat steps 1 and 2

*If repositioning the respirator does not resolve the air leak for the positive or negative pressure check, try a different N95 size/model respirator.
